High Cholesterol

What is High Cholesterol?

Cholesterol is a **fat-like substance** found in every cell in the body, and plays an **important role in a variety of vital functions**, including building and maintaining cell membranes, hormone synthesis, and the manufacturing of Vitamin D.

However, the **body naturally manufactures adequate amounts** of cholesterol to sustain optimal body functioning, and so any extra cholesterol added through our diet is unnecessary. However, levels of **high cholesterol can become potentially dangerous**.

The body manufactures **two types of cholesterol** - LDL (which is seen as a *bad form* of cholesterol) and HDL (which is seen as a *good form* of cholesterol).

When **LDL levels** are too high, fatty deposits or plaque can start to **build up on the walls of the arteries**, decreasing the amount of blood that can flow through them-- posing a greater risk of heart attacks, stroke, arteriosclerosis, or coronary heart disease.

Healthy levels of HDL will help to clean away cholesterol in the arteries before it has a chance to build up. In order to maintain healthy levels, **LDL levels must be kept down and HDL levels up**.

Being diagnosed with **high cholesterol** can be distressing, and it is something that cannot be ignored. The good news is that **cholesterol can be controlled**, and many people use this as an opportunity to make positive lifestyle changes.

Diagnosing High Cholesterol

To test **cholesterol levels**, a physician will **take a blood sample** which is later sent to a laboratory for a lipid profile or analysis. This analysis will show levels of total cholesterol, LDL cholesterol (bad cholesterol), HDL cholesterol (good cholesterol) and triglycerides (a type of fat in the blood).

What are the Symptoms of High Cholesterol?

Like high blood pressure, which is often **referred to as the silent killer**, **high cholesterol** generally **has no symptoms** and is usually only discovered during a routine check up or when something else goes wrong.

If **cholesterol levels** are very high, small **yellow nodules** beneath the skin of the eyes, eyebrows or elbows may be noticed.

The content of this eBook is intended for informational purposes only.

It is not intended to diagnose or treat any medical condition. Nothing in this eBook is intended to be a substitute for professional medical advice, diagnosis, or treatment. Always seek the advice of your physician or other qualified health provider with any questions you may have regarding a medical condition.

Never disregard professional medical advice or delay in seeking it because of something you have read in this eBook or on ANY website.

However, a blood test is the only way to determine [cholesterol levels](#), and according to the American Heart Association, **all adults over the age of 20 should have their [cholesterol levels](#) checked every 3-5 years**-- especially if they are overweight, already have a cholesterol problem, or if there is a family history of heart disease or [high cholesterol](#).

Cholesterol is measured in **milligrams per deciliter** of blood, and there are some standard guidelines that will help determine if [cholesterol levels](#) are too high.

Standard Guidelines for Healthy Cholesterol Levels

The following [cholesterol levels](#) are considered desirable:

Total cholesterol:	below 200 mg/dL
LDL cholesterol:	between 100 and 130 mg/dL
HDL cholesterol:	above 40 mg/dL
Triglycerides:	below 150 mg/dL

Keep in mind that [cholesterol levels](#) will change from person to person depending on the presence or absence of a number of factors that may increase the risk of heart disease. These factors include smoking, age, family history, blood pressure levels as well as HDL [cholesterol levels](#). For the most accurate measurements, don't eat or drink anything (other than water) for nine to 12 hours before the blood test.

What Causes High Cholesterol?

There is a definite **link between [high cholesterol levels](#) and a diet high in dietary cholesterol and saturated fat**, although genetic factors also play an important role. Smoking, diabetes, being overweight and insufficient exercise can also contribute to [high cholesterol levels](#).

Help for High Cholesterol

It is very important to take steps to control [cholesterol levels](#). If it is left untreated, **[high cholesterol](#) can result in serious medical consequences** such as heart disease or a stroke.

The good news is that **[high cholesterol](#) can be well controlled** by combining a healthy lifestyle with the correct medical treatment. Treatment can include synthetic prescription medication, **natural remedies**, or a combination of both.

Research has demonstrated that a combination of natural remedies, regular exercise, and dietary changes can make a **significant** difference to LDL levels, and **reduce or even eliminate the need for prescription drugs**.

Natural ingredients such as Rooibos, Gugulipid and Red Yeast Rice are well known for their beneficial properties of reducing levels of LDL ('bad') and triglyceride, while increasing the levels of protective HDL cholesterol. With a few lifestyle

In addition, she is a trained Clinical Psychologist and has been incorporating natural remedies into her treatment of patients with depression, anxiety, ADD, ADHD and stress for many years with spectacular results.

changes and a little help from nature, [cholesterol levels](#) can be well managed.

Conventional Medical Treatments For High Cholesterol

Many people are prescribed synthetic medication to help reduce their [high cholesterol](#). In response to soaring rates of [high cholesterol](#) and atherosclerosis, the **pharmaceutical** companies have produced a class of drugs which are collectively known as **statins**.

Statins have a one-dimensional effect of reducing the body's ability to synthesize cholesterol. They **do not**, however, distinguish between the 'bad' cholesterol (LDL) and the 'good' cholesterol (HDL) and can also reduce levels of Co-enzyme Q10 and L-carnitine, two very important molecules which are involved in energy production and fat metabolism.

Myalgia and even stomach, lung and liver tumors have also been associated with the use of these drugs. It is very important that people who are taking prescription medication for [high cholesterol](#) be **regularly monitored** by their doctor.

The Facts about Fats

- Modern day society has taught us that “fats” are bad, yet they are usually present in most tasty foods. The fact, the body needs some fats. A certain amount of **dietary fat helps in some very important bodily processes**, such as nutrient absorption, nerve transmission, maintaining cell membranes and hormone production. However, when consumed in excess, fats can lead to a number of health concerns such as weight gain, heart disease and certain types of cancer.
- It is important to **replace the bad fats with good fats** in the diet-- an essential key in trying to maintain healthy [cholesterol levels](#). Bad fats include saturated and trans fats, while good fats include monounsaturated and polyunsaturated fats.
- **Limit the amount of saturated fats consumed.** Saturated fats are mainly found in animal products such as meat, dairy, eggs and certain types of seafood (especially shell fish). Plant foods that are high in saturated fats include coconut oil, palm oil and palm kernel oil.
- **Trans fats are another type of bad fat** with absolutely no nutritional benefit, and should be at the top of the list of fats to avoid. Also known as trans fatty acids, this unhealthy substance is man-made through a chemical process of hydrogenation of oils to increase the shelf life and flavor stability. Unfortunately, trans fats are found in many products such as vegetable shortenings, most margarines, crackers, cookies, snack foods, and fast foods.
- **Monounsaturated fats are known as good fats**, as they lower total cholesterol as well as LDL cholesterol (bad cholesterol), while increasing the HDL cholesterol (good cholesterol) in the system. In moderation, these fats are healthy, and can be found in nuts, canola, and olive oil.
- **Polyunsaturated fats are also a good source of fats** as they too lower LDL cholesterol. Foods containing polyunsaturated fats include salmon and fish oil, most grain products, soy, and sunflower oil. Some mayonnaise and soft margarine may also be good sources, but this will differ between brands, so be sure to check the product label.

- Try replacing **bad fats with healthy fats**. The daily recommended amount of healthy fat should be near 25 g. When “bad fats” are consumed, make sure it is not often, and **limit the amount of these fats where possible**. For example, you can reduce saturated fat intake by making the meat portion of your meal far smaller than your portion of vegetables and whole grains, by opting for low-fat or fat-free products and choosing lean and skinless meat.
- **Replace cooking oils** that are high in saturated or trans fats with fats high in mono and polyunsaturated fats such as canola oil, olive oil and flax seed oil. Also look for soft margarines that include plant sterols, as these [lower cholesterol levels](#) (also present in some orange juices).

Foods to eat: garlic, fish such as tuna and salmon, nuts (especially walnuts and almonds), oatmeal and oat bran, soy, beans, lentils, sweet potatoes, fruits, vegetables (carrots are especially good), whole-grains, and high-fiber foods. When choosing dairy products, always opt for the fat-free and low-fat products.

Foods to avoid: many processed foods, French fries, doughnuts, cookies, crackers, muffins, pies, pastries and cakes, egg yolks, duck, organ meats (such as chicken livers, brains, hearts, kidneys, or sweetbreads), shellfish snacks and meats that are high in saturated fats, fried food, whole-milk dairy products, butter, cream, ice cream, cream cheese.

- If high cholesterol is a known problem, or tends to run in the family, **get levels checked at least every 3 years**.
- Smoking dramatically increases the chance of heart disease, and can compound an existing problem of [cholesterol levels](#). Continuing to smoke therefore puts the heart at serious risk. **Consider quitting smoking naturally!**
- Maintain a healthy weight. One of the first steps to lowering cholesterol is to **lose excess body weight**. While many people find this is the most difficult part, a little dedication, a healthy diet, regular exercise, and some help from a reputable weight-loss program can accomplish fitness goals.
- **Keep physically active**. Exercise helps to raise HDL levels and lower LDL levels, and is especially important for people who are overweight, and those who have high triglyceride and/or low HDL levels.
- **Drink alcohol in moderation**, as binge drinking or excessive alcohol intake increases the chance of heart conditions. Some research shows that moderate intake of certain alcohol, particularly red wine, shows a small increase in HDL or “good” cholesterol. Remember that ‘moderate’ refers to no more than one or two glasses daily!

The Natural Approach

While Western medicine has become the norm in many cultures, it is **not the only treatment option**. Conventional Western medicine (often called allopathic or orthodox medicine) is the system of medicine taught at most medical schools, and many pharmaceutical and synthetic medicines are manufactured and marketed according to the principles of allopathic medicine.

Because most of us in the Western world have grown up in a society in which allopathic medicine is the prevailing norm, we forget that only a few decades ago, homeopathic, herbal and other natural medicines were commonly available and freely used-- even by conventional doctors. While there are often heated debates

about which system of medicine is 'better' than the other, many responsible doctors (whether they are allopathic or not) recognize that **both have a role to play in the treatment program.**

Natural medicine has often been frowned upon by conventional doctors, especially by those who do not have sufficient knowledge of these medicines. However, it is encouraging to note that some medical schools are now beginning to re-introduce it into their course work, thereby **providing doctors with a wider range of treatment options** from which to choose. In many countries, especially in Europe, India and China, **natural and homeopathic medicines are commonly prescribed** by conventional doctors and represent a significant part of the total annual drug sales.

Naturopathy is a branch of medicine (just as allopathy is a branch of medicine) which operates according to the underlying philosophy that the **body has an innate capacity to heal itself.** While natural medicines are often called 'alternative' or 'complimentary' medicines, they are, in fact, a **unique and independent form of medicine** in their own right, well able to **treat a variety of conditions.** Perhaps the term 'holistic' medicine is more apt, given the broad range of treatment options and approaches which are to be found within the practice of natural medicine. This encompasses many different disciplines, including herbalism, homeopathy, iridology, osteopathy, chiropractic, therapeutic massage techniques, aromatherapy, acupuncture and many, many more.

Most naturopaths will use a variety of treatment modalities in order to treat their patients in a **holistic way to support health, relieve symptoms and prevent future disease.** In fact, even the World Health Organization defines health as being "... more than simply the absence of illness. It is the active state of physical, emotional, mental and social well-being." This is a wonderfully clear description of holistic or natural medicine, which strives to **support health** (thereby relieving or preventing symptoms), rather than simply eliminating disease.

Although allopathic medicine certainly has a role to play and has made a tremendous contribution to medical science during the past century, there is a growing perception that it is not the only answer. In many cases, **holistic medicine can accomplish just as much,** if not more – without the risk of side effects, addiction and sacrifice to health so commonly associated with pharmaceutical drugs. Contrary to common perception, and provided that they are manufactured in the correct way, **natural medicines can work quickly and safely to promote healing.**

In many cases, they can **succeed where pharmaceutical drugs have failed.** Despite frequent reports that they are 'unproven' and 'untested', the opposite is true. Natural medicines have a **long history of usage** and there is a **wealth of empirical evidence** to support their effectiveness and safety. In addition, active clinical research is carried out by many academic hospitals and universities to **support the extensive traditional and empirical evidence behind natural medicines.**

It is also important to know that, like any medicine, herbal and homeopathic medicines **must be manufactured in the correct way,** following acceptable procedures and manufacturing methods to ensure maximum effectiveness and safety. Due to the recent rise in popularity of natural remedies, many companies

herbal & homeopathic remedies:

1) All Native Remedies products are manufactured according to the highest pharmaceutical standards - using only the best quality raw ingredients from nature's medicine chest.

2) Native Remedies and our suppliers are registered with the FDA as accredited suppliers and manufacturers of health supplements. Our products are sold all over the world and are manufactured to strict international standards in a GMP accredited manufacturing plant.

3) All our remedies are manufactured in an FDA registered pharmaceutical facility under close supervision.

This includes formulation, acquiring and testing of raw ingredients as well as final manufacturing. This gives us the confidence to say that when you are buying a Native Remedies product, you are buying the safest and the best! We know what goes into our remedies - which is why we know what you will get out of them!

4) Manufacturing is done strictly according to the principles of GMP (Good Manufacturing Practice) and all raw ingredients undergo stringent testing before being approved by our registered manufacturing pharmacists.

5) We offer a free email [Ask Our Experts](#) service run by trained consultants ready to advise you on the best choice for your health.

6) We offer an unconditional [One Year Money Back Guarantee.](#)

have sprung up to take advantage of the market. Unfortunately, **not all of them are equipped to manufacture to the correct standards**, often resulting in a flood of inferior (and sometimes even unsafe) remedies onto the market – and giving natural remedies a bad name.

Even some pharmaceutical companies have rushed to claim their market share by producing so-called ‘standardized’ extracts of herbs and offering these as superior to the tried and tested methods of naturopathic manufacturing. Nothing could be further from the truth. While ‘**standardized**’ extracts may offer benefit of easy consistency of dosage (and cheaper more efficient production lines), they have **grave disadvantages**, including an increase in side effects, as the medicines produced in this manner lose the natural protective properties of the herbs. In some cases, these side effects have proved fatal – as was seen in the liver toxicity associated with standardized extracts of kava kava, a herb previously safely used for generations without any known side effects.

Most naturopaths recommend what is called the Full Spectrum Method of extraction – which **retains the benefits of ALL the active ingredients within the herb** as opposed to isolating only one – thereby providing a more complete treatment as well as superior protection against side effects.

Whatever your choice, **always choose wisely**. Research what is best for you. If you have a chronic or life-threatening condition, don’t make changes without first discussing them with your doctor, in order that your condition may be monitored. **Well-informed and supportive practitioners will support patients** who want to take responsibility for their own health.

Related Natural Remedies:

Cholesto-Rite: Helps maintain healthy LDL and HDL cholesterol levels and promotes the ability to fight free radicals.

Cholesto-Rite is a 100% safe, non-addictive, natural herbal remedy formulated by a team of experts in the field of natural medicine.

Cholesto-Rite has been designed to safely support the body in its ability to **maintain healthy levels of LDL and LDH cholesterol**, while also acting as a general cardiovascular tonic by promoting the body's natural ability to fight harmful free radicals.

Cholesto-Rite supports the **healthy functioning of the liver and cardiovascular system**, thereby helping to maintain balanced cholesterol in the veins and arteries.

Cholesto-Rite not only supports healthy levels of LDL cholesterol, but also encourages healthy levels of HDL, the 'good' form of cholesterol.

Cholesto-Rite contains a selection of herbs known for their **supportive function in maintaining cardiovascular health** and well-being and can make all the difference, without compromising health or risking serious side effects.
